ACTIVE

Self-hosted ·
Oracle Cloud
free tier · 7
isolated
profiles

-
- Designed and operate a 7-profile agent stack (master-orchestrator, IT-service, impex, social, blood-bank, personal, trading-watch) routing memos via classification rules, isolated contexts, and per-profile memory.
 - Channels live on Telegram and Discord with HMAC-signed webhooks, idempotency keys, secret scope per profile (``agent.secret_scope.get_secret``) and log redaction. No outbound telemetry.
 - Safety rails documented per profile: trading-watch is read-only (no broker), blood-bank is log-only
 - Production cron: morning trading briefing (08:55 IST weekdays), weekly paper-trade review (Sunday 19:30 IST), portfolio dashboard refresh (every 5 min).

(no SMS broadcast), personal is scheduling-only (no message-send).

– Live services: TradingView webhook receiver (HMAC-signed, port 5010) → paper-trade SQLite ledger → results dashboard (port 5025) over Cloudflare Tunnel; systemd unit files for webhook / dashboard / 2 cloudflared tunnels.

– Model routing via OpenRouter free tier with credential pool rotation. Prompts designed for cache stability and deterministic tool schemas.

SAP-adjacent Gen-AI use cases (scoped / piloted)

ROADMAP

RISE with
SAP · S/
4HANA · BTP
AI Core ·
Solution
Manager

- RISE + Joule / BTP AI Core: conversational analytics on S/4HANA CDS views for service-delivery PMs — auto-summarise incident root cause from CA-Err-Log + SM21.
- Incident triage copilot: RAG over SAP Notes + KBA + customer-specific runbooks, embedded in Solution Manager as a side-panel; reduces MTTR by surfacing prior similar incidents.
- Automation-of-automation: LLM-generated ABAP / Fiori change-request drafts from incident tickets, reviewed by Basis team
- Workforce pyramid optimisation: clustering on ticket text + SLA data to flag teams with systemic skill gaps, feeding the FTE /

systems

Prompt
caching ·
HMAC ·
secret scope
· no PII to
untrusted
models

- Prompt caching preserved by byte-stable system prompts and no mid-conversation tool mutation.
- HMAC-SHA256 on every webhook; 60-second timestamp window; per-alert idempotency keys.
- All credentials in `~/hermes/.env` with mode 0600. No PII sent to models without explicit user consent.`
- **Relevance for SAP delivery:** the same operational patterns (deterministic tool schemas, secret scoping, replay protection, no-PII gating) translate directly to enterprise RISE with SAP + BTP AI Core deployments where

prompt
caching and
per-tenant
secret
isolation are
production
requirements,
not nice-to-
haves.

Professional Experience — twenty-two years, six companies
